[1] This laboratory offers dimensional testing, commercial calibration and field calibration services.

[2] Calibration and Measurement Capability Uncertainty (CMC) is the smallest uncertainty of measurement that a laboratory can achieve within its scope of accreditation when performing more or less routine calibrations of nearly ideal measurement standards or nearly ideal measuring equipment. CMCs represent expanded uncertainties expressed at approximately the 95 % level of confidence, usually using a coverage factor of $k = 2$. The actual measurement uncertainty of a specific calibration performed by the laboratory may be greater than the CMC due to the behavior of the customer's device and to influences from the circumstances of the specific calibration.

[3] Field calibration service is available for this calibration. Please note the actual measurement uncertainties achievable on a customer's site can normally be expected to be larger than the CMC found on the A2LA Scope. Allowance must be made for aspects such as the environment at the place of calibration and for other possible adverse effects such as those caused by transportation of the calibration equipment. The usual allowance for the actual uncertainty introduced by the item being calibrated, (e.g. resolution) must also be considered and this, on its own, could result in the actual measurement uncertainty achievable on a customer's site being larger than the CMC.

[4] In the statement of CMC; *L* is the numerical value of the nominal length of the device measured in inches for uncertainties given in conventional units and *L* is the numerical value of the nominal length of the device measured in millimeters for uncertainties given in metric units; *D* is the diameter of the device in inches; *R* is the resolution of the device.

[5] In the statement of CMC, the value is defined as the percentage of reading.

[6] Where ranges are not specified, the CMC stated is for the cardinal points only.

[7] This test is not equivalent to that of a calibration.

[8] The contributions from the "best existing device" are not included in the CMC claim.

[9] The stated measured values are determined using the indicated instrument (see Comments). This capability is suitable for the calibration of the devices intended to measure or generate the measured value in the ranges indicated. CMC are expressed as either a specific value that covers the full range or as a fraction or percentage of the reading plus a fixed floor specification.

[10] Adjustable Thread rings are set applicable to specifications using calibrated master set plug gages.

[11] This scope meets A2LA's *P112 Flexible Scope Policy*.

[12] The type of instrument or material being calibrated is defined by the parameter. This indicates the laboratory is capable of calibrating instruments that measure or generate the values in the ranges indicated for the listed measurement parameter.
